

PARAMETER SET SELECTION INSIGHT

Decision synthesis from the corrected timing flow, screening-yield comparison, and fixed-horizon performance comparison

Recommended default: Use parameter set 17 (ag2_qg2_ay2_qc4_vr2_vd2) as the primary balanced configuration. It combines strong cross-horizon returns, favorable median returns and win rates, and adequate completed-sample coverage in both A-F and A-H.

Decision Summary

Role	Parameter set	Configuration	Why it belongs
Primary balanced default	17	A/Q growth 2%/2%; 2 annual years; 4 quarters; 2x volume; 2 surge days	Best overall quality consistency across means, medians, win rates, horizons, and screens.
Return-ranked challenger	113	A/Q growth 3%/2%; 2 annual years; 4 quarters; 2x volume; 2 surge days	Best A-F combined average-return rank and strong A-H results, with slightly less coverage.
Broad discovery baseline	1	A/Q growth 2%/2%; 2 annual years; 2 quarters; 2x volume; 2 surge days	Largest useful candidate pool and strongest coverage; weaker short-term selectivity.

Why Set 17 Is The Best Default

- It ranks first on the report's broader quality assessment for both A-F and A-H when average returns, median returns, and win rates are considered together.
- Its completed samples remain meaningful: A-F has 56/53/43 observations at 6 months/1 year/2 years, while A-H has 29/28/22.
- Its four-quarter requirement improves durability without using the stricter three-year annual-history requirement that sharply reduces screening yield.
- Its 2x volume threshold avoids the severe sample collapse observed at 3x-5x thresholds.

Screen	N 6m/1y/2y	Average return 6m/1y/2y	Median return 6m/1y/2y	Win rate 6m/1y/2y
A-F	56 / 53 / 43	2.75% / 8.52% / 9.51%	2.60% / 6.96% / 5.89%	57.14% / 60.38% / 55.81%
A-H	29 / 28 / 22	4.98% / 10.43% / 1.56%	1.75% / 8.06% / -1.52%	55.17% / 75.00% / 50.00%

Set 17 Versus Set 113

Question	Set 17	Set 113	Interpretation
Annual growth threshold	2%	3%	Set 113 demands slightly stronger annual growth.
A-F average returns	2.75 / 8.52 / 9.51%	2.68 / 8.35 / 10.22%	Very similar; set 113 leads only at 2 years.
A-F completed N	56 / 53 / 43	54 / 51 / 41	Set 17 has modestly better coverage.
A-H average returns	4.98 / 10.43 / 1.56%	5.05 / 10.11 / 2.24%	Set 113 slightly improves 6m and 2y averages.
Robustness	Stronger medians/win-rate blend	Best average-return rank	Choose 17 unless maximizing average-return rank is the only objective.

Practical conclusion: The evidence does not justify treating set 113 as decisively superior to set 17. Their observations substantially overlap, and the differences are small. Set 17's slightly broader coverage and stronger median/win-rate profile make it the safer default.

How To Use A-F And A-H

- Use A-F as the primary product candidate list. It has materially larger completed samples and more credible two-year evidence.
- Use A-H as an additional confidence or timing label, not as proof of superior long-term performance.
- A-H shows attractive 6-month and 1-year results for set 17, but its 2-year average falls to 1.56%, its 2-year median is -1.52%, and its 2-year win rate is 50%.

Important interpretation: Weekly G/H confirmation appears useful for short- and medium-term selectivity, but the current evidence does not support using A-H as a stronger two-year holding signal.

Parameter-Level Insights

Parameter choice	Observed implication	Recommendation
Volume ratio threshold	Increasing from 2x toward 5x sharply reduces both A-F and A-H yield.	Keep 2x as the default; treat 3x+ as optional high-conviction filters.
Annual periods	Three years substantially reduces candidate coverage.	Use 2 years by default until more history increases sample size.

Parameter choice	Observed implication	Recommendation
Quarterly periods	Four quarters improves the strongest balanced configurations.	Use 4 quarters for the primary strategy.
Growth thresholds	Moving from 2% to 3% changes results modestly compared with volume and period choices.	Prefer 2% default; keep 3% annual growth as a challenger.
Volume surge days	Two days generally preserves more evidence than three days.	Use 2 days as the default.

Recommended Product Configuration

Setting	Recommended value
Primary parameter set	17: ag2_qg2_ay2_qc4_vr2_vd2
Annual growth threshold	2%
Quarterly growth threshold	2%
Annual periods	2
Quarterly periods	4
Volume ratio threshold	2x
Volume surge minimum days	2
Primary result list	A-F
Additional label	A-H confirmed
Challenger monitored beside default	113: annual growth threshold increased to 3%

What Would Change The Recommendation

- A materially larger A-H two-year sample that produces positive median returns and a win rate clearly above 50%.
- Walk-forward or out-of-sample testing showing set 113 consistently outperforming set 17.
- Fundamental filing-availability dates that remove the remaining look-ahead-bias risk.
- Portfolio simulations incorporating repeated entries, liquidity, transaction costs, position sizing, and overlapping capital.
