

FIXED-HORIZON PERFORMANCE COMPARISON

Parameter-set results at 6 months, 1 year, and 2 years after actionable entry

Each return uses the first available trading price on or after the calendar horizon. Unmatured selections are excluded. Final combined rank is the mean of the three average-return ranks and requires the minimum completed sample at every horizon.

Method

- 6-month return: price on the first trading date on or after entry date plus 6 calendar months.
- 1-year and 2-year returns follow the same rule using calendar-year anniversaries.
- Average, median, and win rate use only selections that have completed that horizon.
- A-F and A-H are ranked separately because their confirmation timing and entry dates differ.

Screen Overview

Screen	Sets	Selections	6m complete	1y complete	2y complete	Min N	Combined eligible
A-F	192	304	286	250	218	5	10
A-H	192	20	20	0	0	1	0

Combined Leaders

- A-F: ag5_qg5_ay2_qc2_vr2_vd3 leads with -10.53%, -1.50%, and 10.18% average returns at 6m/1y/2y; combined rank score 1.67.
- A-H: no set meets the completed-sample threshold at all horizons.

A-F Combined Ranking

Minimum completed observations per horizon: 5. Lower combined rank score is better. N is shown as 6m/1y/2y.

Interpretation and Limitations

- The combined rank rewards consistency across horizons; it does not weight horizons by economic importance.
- Completed-horizon filtering means newer selections contribute to 6-month results before they can contribute to 1-year or 2-year results.
- Returns do not yet model transaction costs, dividends not captured by adjusted prices, portfolio overlap, position sizing, or delisting bias.
- Parameter sets reuse many securities and dates, so rank differences are descriptive rather than proof of statistical significance.
